An Abstract of the Disclosure is provided herewith on a separate sheet.

Abstract of the Disclosure

The present invention concerns a method and a device for interlocking a disconnecting breaker. During interlocking of a single-poled or multiple-poled disconnecting breaker, the actuator of the breaker is first interlocked both electrically and/or mechanically. When the breaker is in the open position, the distance between the contacts of the breaker comprises the conductor spacing for the isolation function. The electrical and mechanical interlocking of the actuator may be indicated both electrically and mechanically. Subsequently, the link system of the breaker is mechanically interlocked. Interlocking of the link system may be indicated by at least one indicator. Interlocking of the actuator of the breaker can be controlled manually via a key- and lock device, or remotely.
